

ABSTRACT

There is provided an image forming sheet with a mark which can reliably identify the presence or absence of the image forming sheet and/or the type of the image forming sheet without sacrificing the design and a visual texture of the sheet. In the image forming sheet 1, an identification mark 2, which is less likely to be visually perceived from the external appearance of the sheet 1, is provided within the sheet 1. The image forming sheet 1 may have a laminate structure of a plurality of substrate sheets 3 between which the identification mark 2 is provided. The identification mark 2 absorbs an electromagnetic radiation with a wavelength  $\lambda_1$  and emits an electromagnetic radiation with a wavelength  $\lambda_2$  different from the wavelength  $\lambda_1$  and can reliably identify the presence or absence of the image forming sheet and/or the type of the image forming sheet without sacrificing the appearance and design of the sheet.
